

7. Designideen, Arbeitsprinzip und Prozess (Projekt 2)

Das intelligente Warnsystem für Kleidung wird für die Menschen, die jeden Tag zur Arbeit gehen müssen aber nicht genug Zeit haben, um die Kleidungen rechtzeitig von draußen zurückzunehmen, entwickelt.

Das System verfügt über folgende Funktionen:

- (1) Erfassung der aktuellen und zukünftigen Wetterinformationen von draußen
- (2) Erfassung der aktuellen Informationen der Kleidungen
- (3) Analyse der Kleidungs- und Wetterzustand und deren Sendungen durch E-Mail
- (4) Entwicklermodus

Wenn das Wetter gut ist, macht das System gar nichts. Aber wenn es nicht so schön für die zu trocknenden Kleidungen ist, wie z.B. regnen oder schneien in drei Stunden, alarmiert das System durch Sendung eines (bis maximal drei pro Tag) E-Mails, damit die Leute rechtzeitig die Kleidungen zurückzunehmen können. Es ist aber auch möglich, das System mit einem Motor integriert, um automatisch die Kleidungen nach Hause zu transformieren.

Die Erfassung der Kleidungszustand wird durch zwei DHT11 Sensoren realisiert. Dabei werden die Temperatur sowie Feuchtigkeit gemessen und durch MQTT-Protokoll übertragen. Um Genauigkeit zu sichern, werden zwei Sensoren statt ein ausgewählt. Und durch Vergleich der Kleidung- und Wetterzustand wird ein Ergebnis gegeben, ob die Kleidungen schon trocknet werden haben. Wenn ja, sendet das System ein E-Mail.

Dank des Entwicklermodus kann man selbst die Sensoren Daten einstellen, damit beim Debug die möglichen Fehler gefunden werden können.

8. Hardware-Aufbau und Beschreibung (Projekt 2)

8.1 Hardware

Die wichtige Hardware des Systems besteht aus den folgenden Teilen:

1. zwei DHT11 Sensoren

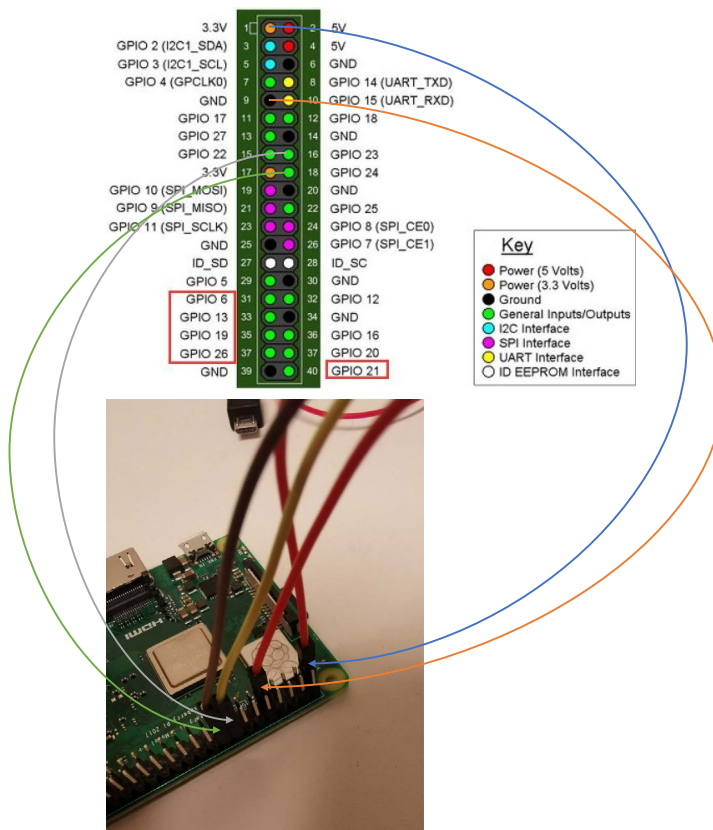

2. zwei Raspberry Pi (Typ: 3B+ und 3B)
3. zugehörige Kabel und Breadboard

8.2 Steuerung von DHT11 Sensoren

Pin-Belegung

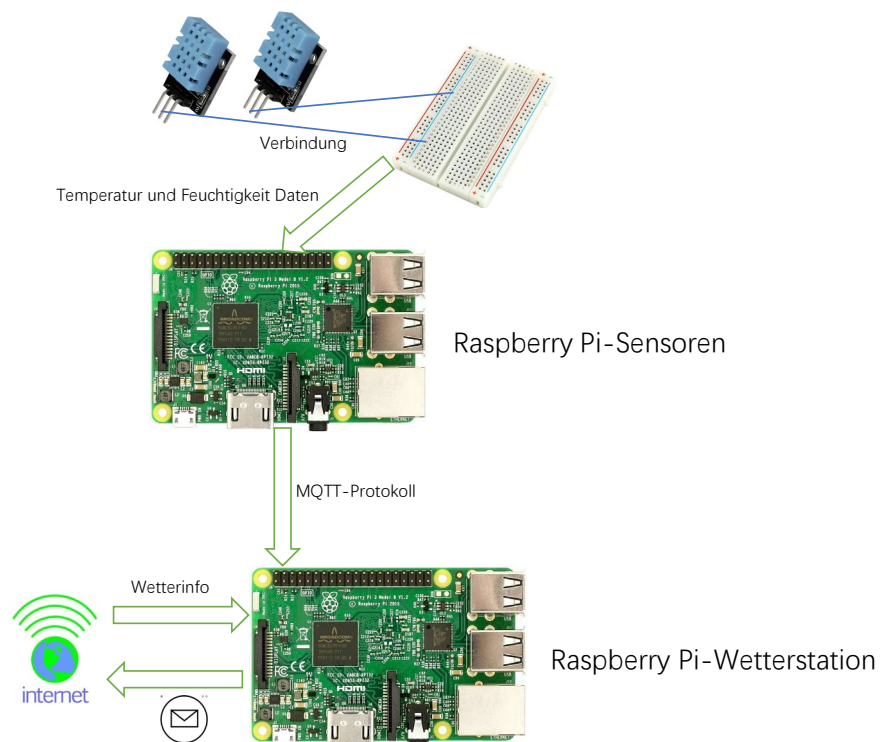

Nach Prüfung der Raspberry-PIN werden folgenden Kabeln wie untern verbunden:

8.3 Hardware-Aufbau

Die Hardware-verbinding wird wie untern realisiert.

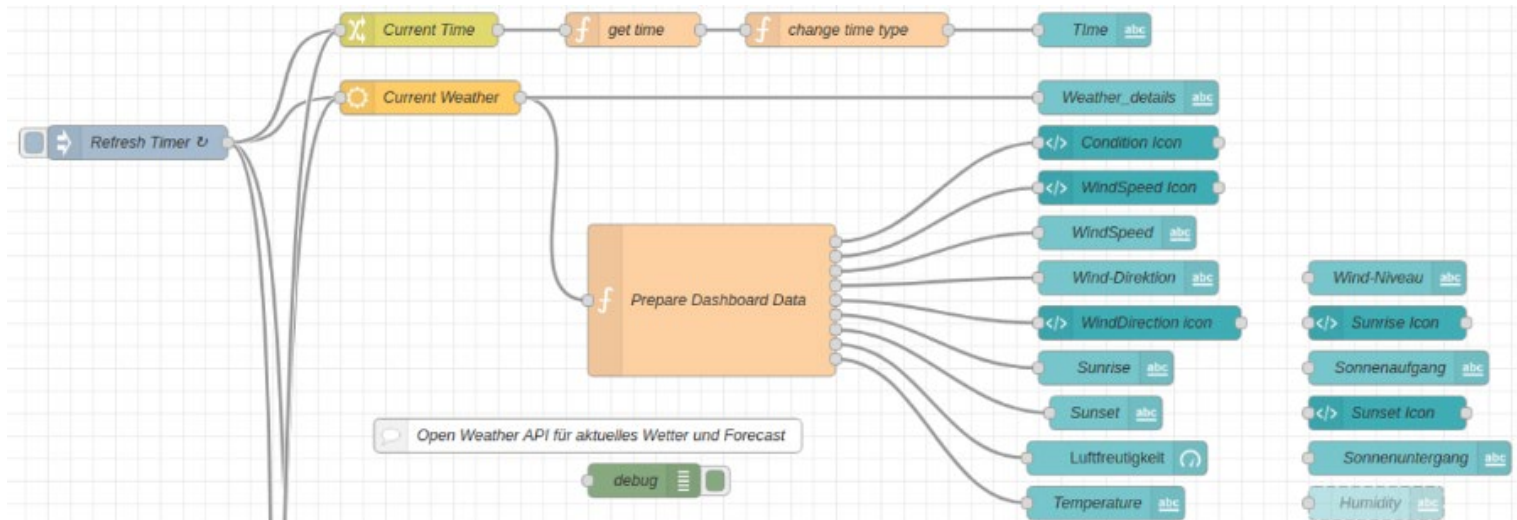

9. Node-RED-Programmierung (Projekt 2)

In diesem Kapitel wird eine Node-RED-Programmierungsablauf beschrieben.

9.1 Programm für die Raspberry Pi-Wetterstation Design:

9.1.1 Programm für Erfassung der aktuellen Wetterinformationen

(1) Beschreibung „Current Time“

Das ganze System muss automatisch erneuern können, um die aktuellsten Informationen zu bekommen. Deshalb wird „Current Time“ entwickelt.

Zuerst wird im „Current Time“ timestamp erfasst.

Function

```
1 var d = new Date();
2 d.setHours(d.getHours() + 1);
3 time= d.toISOString();
4 msg.payload = time;
5 return msg;
```

Dann wird Datentyp geändert.

(2) Beschreibung „Current Weather“

Dank der integrierten Funktion „Openweathermap“ ist die Erfassung der aktuellen sowie zukünftigen Wetterinformationen realisierbar. Nach erfolgreichem Einloggen und Einstellung bekommt man die jeweiligen Wetterinformationen. (wie unten gezeigt)

(3) Beschreibung „Prepare Dashboard Data“

Nach der Erfassung muss man den Datentyp vielfach verändern, um sie im Dashboard besser zu zeigen. Die Programmiersprache in Node-Red ist JavaScript, wie unten gezeigt.

```

var windDirection = {};
var windDirectionIcon = {};
var windSpeed = {};
var windSpeedIcon = {};
var sunRise = {};
var sunSet = {};
var conditionIcon = {};
var date = new Date();
var humidity = {};
var temperature = {};

/* function for converting meteorological degree to text */
var degToCard = function(deg) {
  if (deg > 11.25 && deg <= 33.75) {
    return "Nord-Nord-Ost";
  } else if (deg > 33.75 && deg < 56.25) {
    return "Nord-Ost";
  } else if (deg > 56.25 && deg < 78.75) {
    return "Ost-Nord-Ost";
  } else if (deg > 78.75 && deg < 101.25) {

sunRise, sunSet, humidity, temperature];

```

9.1.2 Programm für Erfassung der zukünftigen Wetterinformationen

(1) Beschreibung „5 Day Forecast“

Durch dieses Modul kann man das Wettervoraussagen bis zum 5 Tage bekommen. Aber es ist nicht notwendig, wenn wir alle Informationen benutzen. In Hinsicht auf Kleidung benutzen wir auf diesem Fall nur eintägige Wetterinformationen. (3 Stunden * 8-mal)

2

Achtung: Eine Voraussetzung für richtigen Display auf Raspberry-Pi ist Herunterladen der Wetter-Icons aus Internet und zugehörige Einstellungen, als Detail bitte siehe:

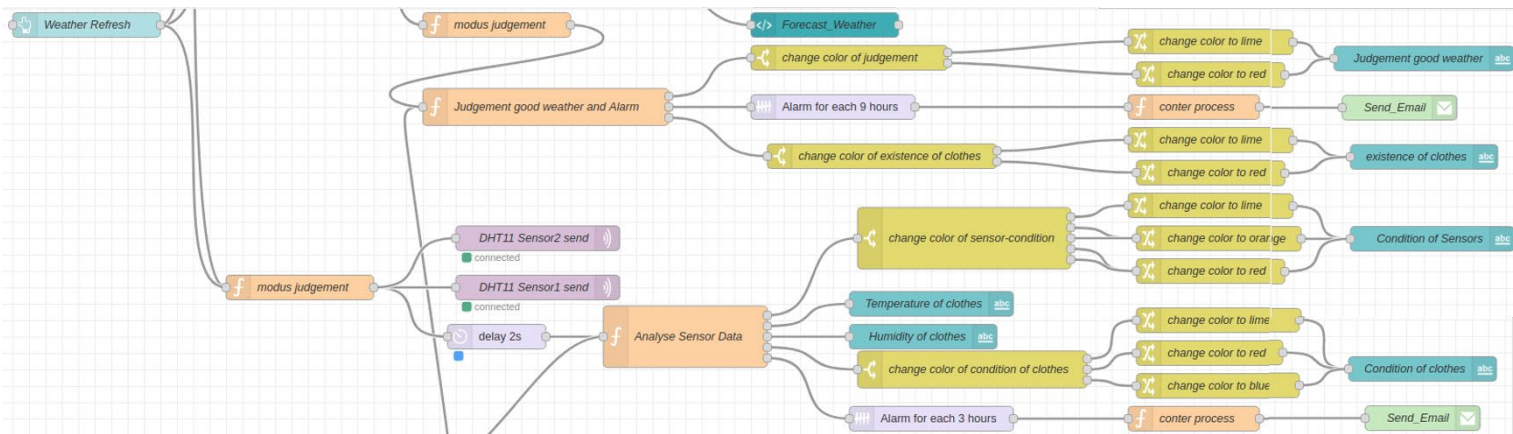

<https://github.com/Paul-Reed/weather-icons>

auch

<https://erikflowers.github.io/weather-icons/>

Gleichzeitig muss man darauf beachten, dass es jederzeitig genug Speicherplatz auf Raspberry-Pi gibt.

9.1.3 Programm für Analyse der Wetter- und Kleidungszustand

(1) Beschreibung „Judgement good weather and Alarm“

In dieses Modul analysiert Raspberry-Pi die Wetterinformationen, ob das Wetter gut ist. Einerseits wird das Ergebnis auf Dashboard gezeigt, andererseits sendet das System beim Bestehen der Kleidung und schlechten Wetter jeder neun Stunden ein E-Mail.

```

var judge = "Ja";
var icon = "0";
var k = 0;
var msg2 = {};
var msg1 = {};

var msg3 = {};
var testclothes = global.get("clothes");
var judgeget11 = global.get("get11");
var judgeget66 = global.get("get66");
var judgesudo = global.get("sudo");
var forecastdata = global.get("forecast");
msg3.payload = testclothes;

if (judgesudo === 1){
  if (judgeget66 === "ja"){
    judge = "ja";
  }else if (judgeget66 === "nein"){
    judge = "nein";
  }
  if (judgeget11 === "ja"){
    msg3.payload = "ja";
    alarm0 = forecastdata[0].weather[0].icon;
    alarm1 = forecastdata[1].weather[0].icon;
    alarm2 = forecastdata[2].weather[0].icon;
    if (alarm0 === "09d" || alarm0 === "10d" || alarm0 === "11d" || alarm0 === "13d" ||
    alarm0 === "50d" ||
    alarm0 === "09n" || alarm0 === "10n" || alarm0 === "11n" || alarm0 === "13n" ||
    alarm0 === "50n" ){
      msg2.payload = "Vorsicht! Es regnet in drei Stunden, bitte nehmen Sie ihre Kleidungen zurück!";
    }else if (alarm1 === "09d" || alarm1 === "10d" || alarm1 === "11d" || alarm1 === "13d" ||
    alarm1 === "50d" ||
    alarm1 === "09n" || alarm1 === "10n" || alarm1 === "11n" || alarm1 === "13n" ||
    alarm1 === "50n" ){
      msg2.payload = "Vorsicht! Es regnet in drei bis sechs Stunden, bitte nehmen Sie ihre Kleidungen zurück!";
    }else if (alarm2 === "09d" || alarm2 === "10d" || alarm2 === "11d" || alarm2 === "13d" ||
    alarm2 === "50d" ||
    alarm2 === "09n" || alarm2 === "10n" || alarm2 === "11n" || alarm2 === "13n" ||
    alarm2 === "50n" ){
      msg2.payload = "Vorsicht! Es regnet in sechs bis neun Stunden, bitte nehmen Sie ihre Kleidungen zurück!";
    }
  }else if (judgeget11 === "nein"){
  }
}
}
}
}

return [msg1,msg2,msg3];

```

(2) Beschreibung „Analyse Sensor Data“

Hier wird eine Toleranz zwischen den aus Sensoren angegebenen Temperatur sowie Feuchtigkeit der Kleidung und den aus Internet erfassten Wetterinformationen eingestellt. Der Betrag der Toleranz ist 20 Prozent (Wie unten gezeigt)

Wenn die Differenz dazwischen kleiner als 20 Prozent ist, wird das Ergebnis als „Die Kleidung ist schon getrocknet.“ gegeben. Gleichzeitig sendet es jede drei Stunden ein E-Mail.

```

var con1 = global.get("condition1");
var con2 = global.get("condition2");
var msg1 = {};
var err1 = global.get("errors1");
var err2 = global.get("errors2");
var humi1 = global.get("humidity1");

      msg4.payload = "ja";
      msg5.payload = "Die Kleidung ist schon getrocknet."
    }else {
      msg4.payload = "nein";
      msg5 = null;
    }
  }
  }else{
  3
}

```

9.1.5 Programm für Schnittstelle (Dashboard)

Die Schnittstelle sowie Dashboard wird in obigem Bild dargestellt. Daraus kann man erkennen, dass es insgesamt sieben Funktionsbereiche gibt.

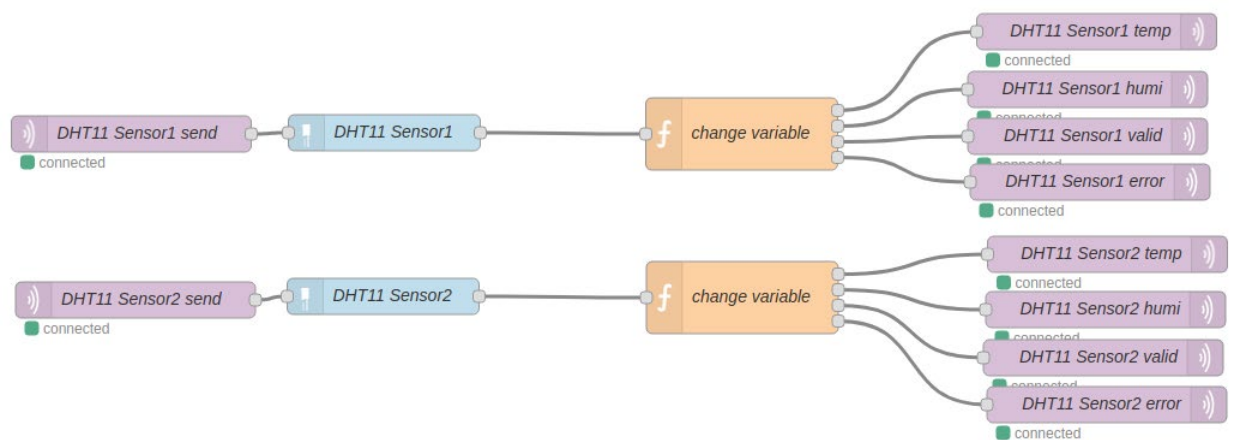

Funktionsbereiche „Aktuelle Wetterinformationen“ und „Aktuelle Wetterinformationen“ werden in 9.1.1 integriert.

Funktionsbereiche „Voraussagen“ werden in 9.1.2 integriert.

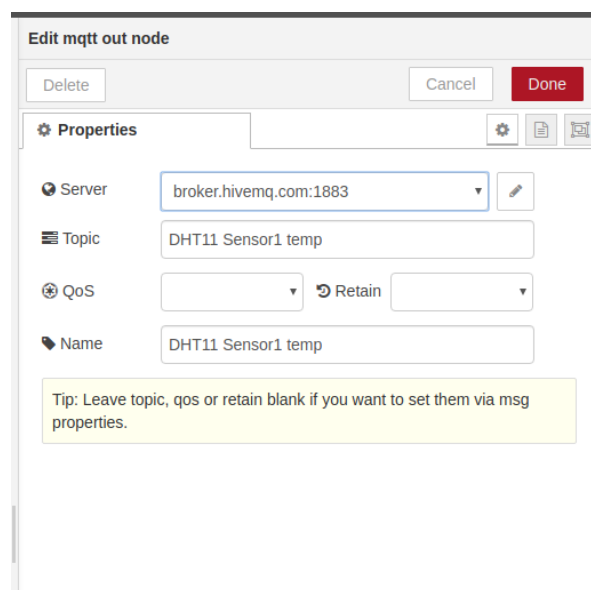

Funktionsbereiche „Aktuelle Kleidungsinformationen“ werden in 9.1.3 integriert.

Funktionsbereiche „Entwicklermodus“ werden in 9.1.4 integriert.

9.2 Programm für die Raspberry Pi-Sensoren Design:

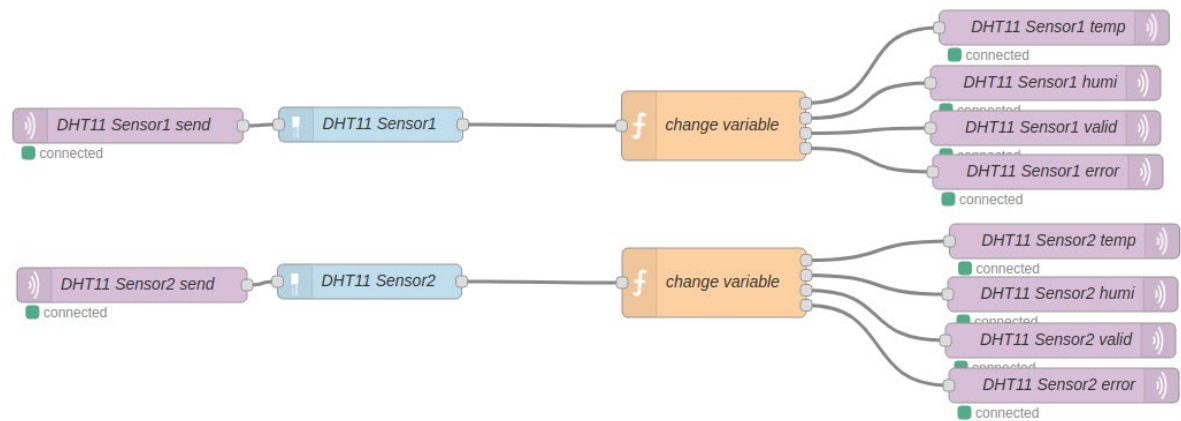

Das Programm für die Raspberry Pi-Sensoren sieht einfach aus. Dank des Node-RED kann man gerade das Modul „DHT11 Sensor“ benutzen. Nach der Veränderung des Datentyps überträgt durch MQTT-Protokoll die Daten. Unter ist die Einstellung des MQTT-Protokolls.

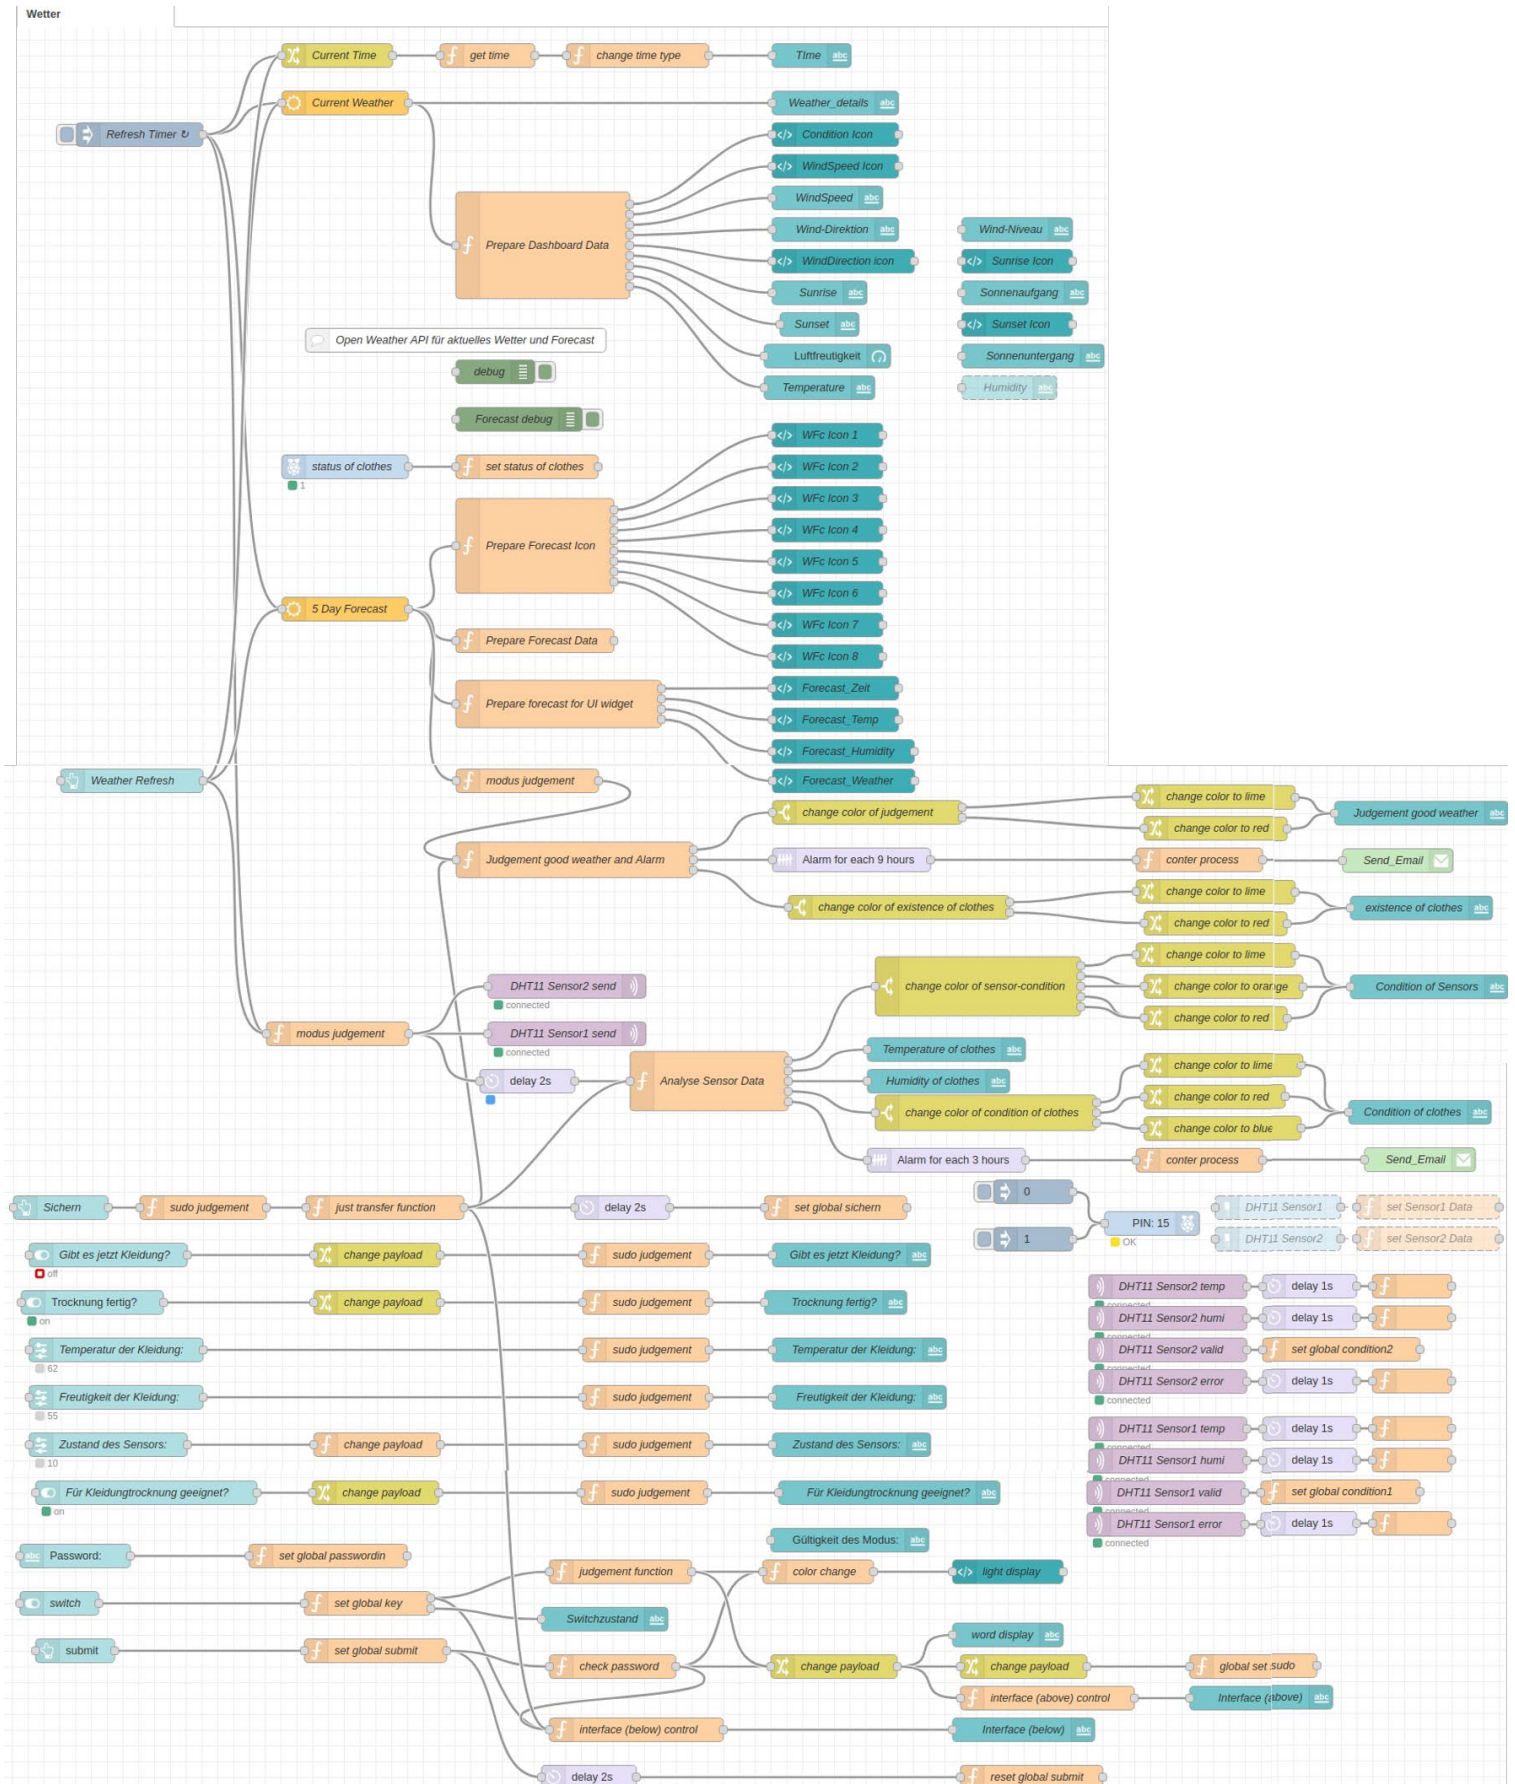

10. Programmfluss der Sensor und Wetterstation

10.1 Node-Red

10.1.1 Sensor-Raspberry Pi

10.1.2 Wetterstation

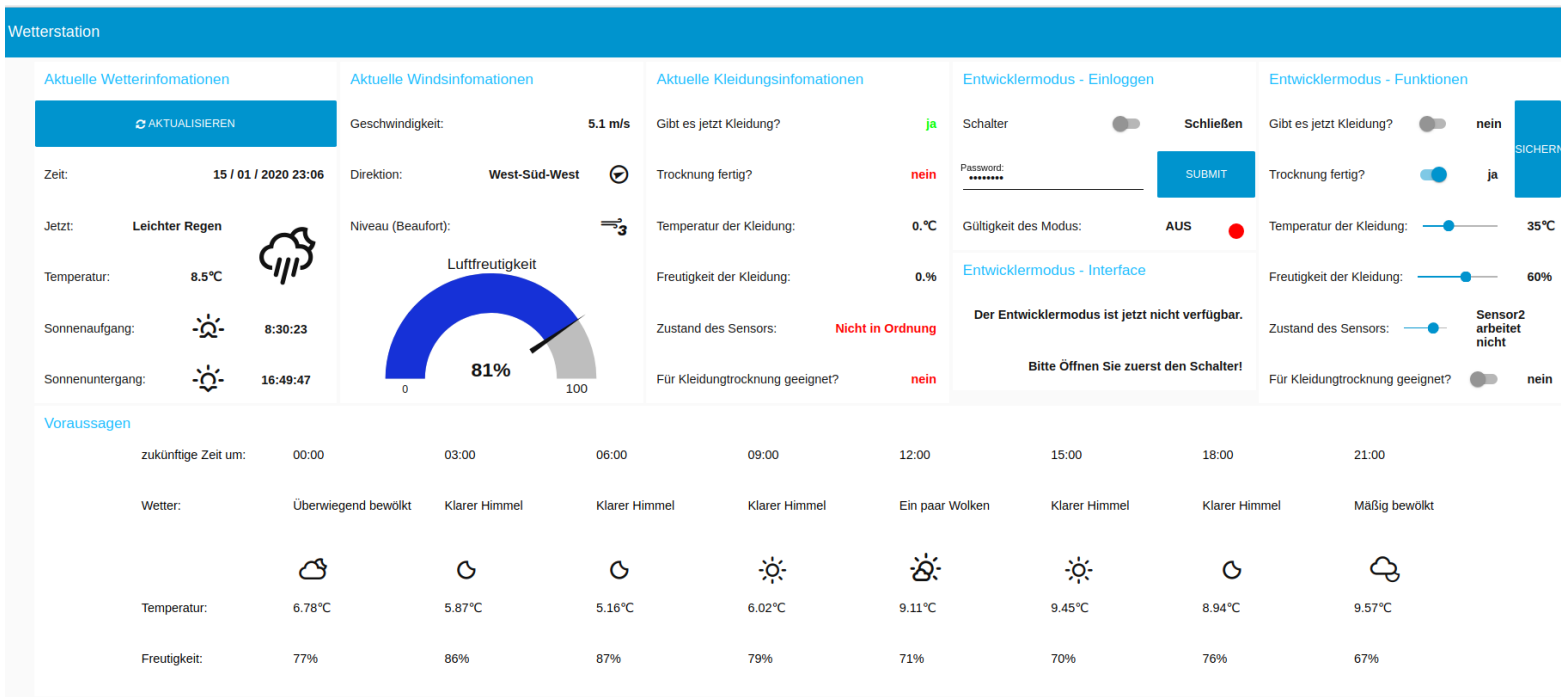

10.2 Design der Dashboard-Steuerungsschnittstelle
